| Bright, indirect | When top 2-3 in. dry | 40-60%+  | Easy - Moderate |

### About the plant

Monstera deliciosa, often called the Swiss cheese plant, is a tropical climbing plant known for its large, split leaves. Indoors, it grows best when given steady warmth, filtered light, and a support such as a moss pole or trellis.

### Light

**Best:** Bright, indirect light for much of the day. A position near an east-facing window or a few feet back from a bright south- or west-facing window usually works well.

**Watch for:** Harsh direct afternoon sun can scorch leaves. Very low light may produce smaller leaves with fewer splits.

### Watering

Allow the top 2-3 inches of potting mix to dry before watering again. Water thoroughly until excess drains from the pot, then empty the saucer. Avoid keeping the roots continuously wet. During cooler or darker months, the plant may need water less frequently.

### Soil & feeding

Use a loose, well-draining mix that still holds some moisture. A houseplant mix amended with orchid bark and perlite is a practical choice. Feed with a balanced houseplant fertilizer during active spring and summer growth, following the product label. Reduce feeding when growth slows.

### Temperature & humidity

Aim for normal indoor temperatures around 65-85 F (18-29 C). Keep the plant away from cold drafts and heating vents. Average household humidity is often adequate, but moderate humidity can help prevent dry leaf edges.

### Routine care

**Support:** Tie climbing stems loosely to a moss pole or trellis as the plant matures.

**Cleaning:** Wipe broad leaves occasionally with a damp cloth to remove dust.

**Repotting:** Repot when roots become crowded or the pot dries unusually quickly, typically moving up only one pot size.

### QUICK TROUBLESHOOTING

| Symptom                   | Common cause to check                                               |
|---------------------------|---------------------------------------------------------------------|
| Yellowing leaves          | Overwatering, poor drainage, or natural aging of older leaves       |
| Brown, crispy edges       | Dry air, inconsistent watering, or excessive fertilizer salts       |
| Long stems / small leaves | Insufficient light or lack of climbing support                      |
| Dark, soft stems          | Possible root or stem rot; inspect roots and reduce excess moisture |

**Pet note:** Monstera contains calcium oxalate crystals and should not be chewed by pets or children. Contact an appropriate medical or veterinary professional if ingestion causes concerning symptoms.
